IMPLEMENT LINEAR AND LOGISTIC REGRESSION

AIM:

To write an R code to implement linear and logistic regression.

PROCEDURE:

- 1. Create sample data for heights and weights, fit a linear regression model, and plot the data with the regression line.
- 2. Use the sample data to create a data frame for the regression model.
- 3. Fit the linear regression model using the 'lm()' function and display the summary.
- 4. Plot the data points and add the regression line using the 'plot()' and 'abline()' functions.
- 5. Load the 'mtcars' dataset, convert the 'am' variable to a factor, fit a logistic regression model using the 'glm()' function, and plot the probabilities.

PROGRAM CODE:

a) Linear regression

```
# Linear Regression heights <- c(150, 160, 165, 170, 175, 180, 185) weights <- c(55, 60, 62, 68, 70, 75, 80) data <- data.frame(heights, weights) linear_model <- lm(weights ~ heights, data = data) print(summary(linear_model))
```

```
# Plotting Linear Regression plot(data$heights, data$weights, main = "Linear Regression: Weight vs. Height", xlab = "Height (cm)", ylab = "Weight (kg)", pch = 19, col = "blue")
```

Reg.No: 210701320

abline(linear_model, col = "red", lwd = 2)

OUTPUT:

b) Logistic regression

```
# Logistic Regression data(mtcars) mtcarsam < -factor(mtcars<math>am, levels = c(0, 1), labels = c("Automatic", "Manual")) logistic_model <- glm(am \sim mpg, data = mtcars, family = binomial) print(summary(logistic_model))
```

Reg.No: 210701320

OUTPUT:

	Reg.No: 210701320
RESULT: Thus the R program to implement Linear and Logistic Regression has be	een executed and
verified successfully.
